Project Management: Issues and Projects

Learn about issues and projects on GitHub, two features that make it easier to track tasks!

The Issues Tab

When looking at a GitHub repository, we see a tab called **Issues**. This is a built-in GitHub tracking tool for all the bugs, errors, and potential small feature changes for the project living inside the repository. In one view, collaborators of the repository can see what needs to be worked on (open issues) as well as which tasks were resolved (closed issues). Take a look at the [Codecademy docs Issue board](#):

Filters

[Entry Request] Java: Files good first issue hacktoberfest java new entry

#307 opened on Oct 5 by sonnynomnom 6 tasks done

The issue board acts as a forum for all the collaborators of the repository. In some instances, issue boards are public and users of a project can submit and discuss bugs they've encountered.

some instances, issue boards are public and users of a project can submit and discuss bugs they've encountered.

Labels

To help organize issues when more and more pop up in a project, we can use labels. **bug** and **feature** are common labels used to differentiate between errors and new features. In the Codecademy Docs repo Issue board earlier, we could see labels such as **Good first issue**, if a suggested entry to Docs is **new** or an **edit**, and what language the entry should be in, like **C#** or **Java**. Labels help us toggle between different types of issues at a glance and have short names.

Creating an Issue

To create an Issue, we can click the **New Issue** button on top of the Issues board. This will take us to a new page where to set the title and content of the issue.

Issues are a bit like pull requests in that we want to keep the title specific but to the point. For descriptions, repositories often have their own guidelines (just like pull requests do) for including details. For example, if the issue is related to a bug, we should include the error message in the description. Check out a complete issue from the Facebook Folly repository:

Typedef redefinition #1658

arthurgeron-work commented on Sep 21

When building a react native project with Folly @.110.0 I get the following error:

```
ios/Pods/RCT-Folly/Folly/portability/Time.h:52:17: Typedef redefinition with different types ('uint8_t' (aka 'unsigned char') vs 'enum clockid_t')
```

arthurgeron-work mentioned this issue on Sep 21

fix: typedef redefinition error #1659

can add to the discussion and reference this issue by the # in other issues and pull requests.

GitHub Project Management

GitHub projects is a beta feature (as of late 2021) for project management. While other project management tools exist, like JIRA or even handwritten post-its, GitHub projects allow direct integration within the repository, letting developers stay within the same ecosystem. We can also create automated project boards that trigger the status of issues and pull requests. And... it's completely free!

To try out projects, we can select the **New Project** option after clicking the **+** button on the upper right side of the GitHub dashboard. In most cases, projects are linked to repositories, which already have existing issues and pull requests, but in other cases, projects can be standalone.

After filling out the name and description of the new project, a drop-down will appear asking what Project template we want to use.
