

# **Important Git Operations**

# **Showing Latest Commit Log**

In Git, the commit you are currently on is known as the HEAD commit.

The output of the git show HEAD command will display everything the git log command displays for the HEAD commit, plus all the file changes that were committed.

\$ git show HEAD

#### Git Reset Using SHA

In Git, the <code>git reset commit\_SHA</code> command can be used to set <code>HEAD</code> to the <code>commit\_SHA</code> commit. The <code>commit\_SHA</code> argument is the first seven digits of a previous commit's <code>SHA</code>. In this example, the <code>HEAD</code> was reset to the commit made on <code>Wed Jan 6</code>.

You can use git log to see a record of previous commits and their SHA values.

\$ git log commit

Completed first line of dialogue

\$ git reset 3ba6efb

# **Staging Multiple Files**

In Git, the git add filename\_1 filename\_2 command is used to add multiple files to the staging area at once. You can use git status to check if you properly added your files to the staging area.

\$ git add scene-5.txt scene-7.txt
\$ git status
On branch master
Changes to be committed:
 (use ""git reset HEAD <file>..."" to
unstage)

modified: scene-5.txt
modified: scene-7.txt

# **Remove File from Staging**

In Git, the git reset HEAD filename command will remove filename from the staging area. Note that this command does *not* discard file changes from the working directory. You might use this command if you've added a file to the staging area, but the file includes incorrect edits.

You can use the git status command to make sure your file was properly removed from the staging area.

#### **Rolling Back to Last Commit**

In Git, the git checkout HEAD filename command rolls back all changes that have been made to filename since the last commit. In other words, this command will change your working directory to look exactly as it did when you last made a commit.

You can use the git diff command to see if the rollback was successful. If git diff doesn't output anything, this means your working directory matches your last commit.

#### git stash

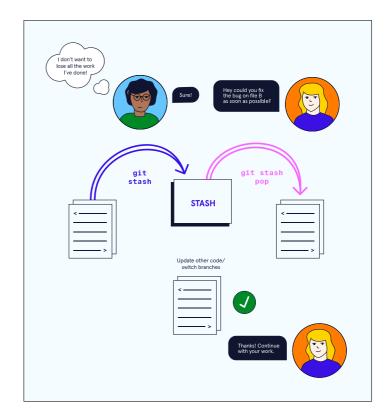

git stash allows you to get back to a clean commit point with a synchronized working tree, and avoid losing your local changes in the process of switching branches or tasks.

You're "stashing" your local work temporarily in order to update a previous commit and later on retrieve your work.

You can use git stash pop to retrieve from your stash.

- \$ git checkout HEAD scene-5.txt
  \$ git diff
- Ś

# git log options

git log allows you to view the commit history of the branch you currently have checked out.

git log --oneline show the list of commits in one line format. 'git log -S "keyword" displays a list of commits that contain the keyword in the message.

git log --oneline --graph displays a visual representation of how the branches and commits were created in order to help you make sense of your repository history.

# git commit -amend

git commit --amend flag allows you to update a commit. To avoid creating a new one, you could create your changes, stage them with git add and then type the command git commit --amend to update your previous commit.

The terminal editor will ask you to update your commit message.

```
** De/Codecademydit/Deno ** P. co=feature_express=scrver=skaleton **

** 101 tog --onellne --graph **

** 101 tog --onellne --onellne
```

```
Trope branch 'co_feature_express_server_skeleton' of https://github.com/CGrijalva90/demo into cg_feature_express_server_skeleton '

1  # Please enter the commit message for your changes. Lines starting
3  # with '0' will be ignored, and an empty message aborts the commit.

5  # Date: Wed Oct 27 12:54:56 2021 -08408

6  # On branch cg_feature_express_server_skeleton

8  # Your branch is up to date with 'origin/cg_feature_express_server_skeleton'.

9  # On branch cg_feature_express_server_skeleton

10  # Changes to be committed:

11  # modified: helpers.js
```

# Git aliases

If you have a set of commands that you use regularly and want to save some time from typing them, you can easily set up an alias for each command using Git config.

The following terminal command

```
git config --global alias.glop "log -
-pretty=format:"%h %s" --graph"
```

allows you to reduce the entire command to:

```
git glop
```
